

Comparação Spyro–SPECFEM e Análises de Convergência

Propagação de ondas elásticas 2D e 3D

Comparação 2D: Sismogramas nos receptores

Componente u_x

Componente u_z

Malhas grau 4, $h = 0.02$, $t_f = 1.5 \text{ s}$, $\Delta t = 10^{-3} \text{ s}$.
 $\epsilon_{L2}(u_x) = 3.13\%$, $\epsilon_{L2}(u_z) = 3.16\%$.

Comparação 2D: Detalhe dos traços

Traços sobrepostos (topo), diferença Spyro—SPECFEM (meio) e zoom na região de maior erro (base).

Comparação 3D: Sismogramas nos receptores

u_x

u_y

u_z

Malhas grau 4, $h = 0.10$, $t_f = 1.5$ s, $\Delta t = 10^{-3}$ s.
 $\varepsilon_{L2}(u_x) = 3.66\%$, $\varepsilon_{L2}(u_y) = 3.64\%$, $\varepsilon_{L2}(u_z) = 3.63\%$.

Comparação 3D: Traço do receptor central

Comparação 3D: Detalhe dos traços

Comparação 3D: Spyro vs SPECFEM3D — Traços e Erros

Convergência 3D em receptores — Referência numérica

Setup:

Topo livre + Dirichlet, $h_{\text{ref}} = 0.07$

41 receptores, $t_f = 0.4 \text{ s}$, $\Delta t = 6 \times 10^{-4} \text{ s}$

Resultado:

$p_{ux} \approx 1.72$, $p_{uy} \approx 1.85$, $p_{uz} \approx 2.07$

Curvas abaixo de $O(h^5)$ — dominadas por projeção/interpolação e desalinhamento receptores—nós.

Convergência 2D — Setup top-only (espectral e KMV)

Setup:

Free surface no topo, Dirichlet nas demais
100 receptores, $t_f = 0.9$ s, $\Delta t = 5 \times 10^{-4}$ s

Espectral:

$p_{ux} \approx 4.20$, $p_{uz} \approx 3.68$

KMV:

$p_{ux} \approx 4.69$, $p_{uz} \approx 4.63$

Ambos com alta ordem após correção do VOM.
KMV mais próximo de $O(h^5)$.
